Garbage Collection in C#.NET

Garbage Collection

- Garbage collection is a process of deleting unreferenced variables or objects from memory.
- Garbage collection will be performed automatically; but it will be performed at the end of main method only.
- To perform garbage collection immediately, use System.GC.Collect() method.
- **Syntax:** System.GC.Collect();

HARSHA

Garbage Collection - Example

Creating Project

- Open Visual Studio 2015.
- Go to "File" – "New" – "Project".
- Select ".NET Framework 4.6".
- Select "Visual C#".
- Select "Console Application".
- Type the project name as "GarbageCollectionExample".
- Type the location as "C:\CSharp".
- Type the solution name as "GarbageCollectionExample".
- Click on OK.

Program.cs

```
using System;

namespace GarbageCollectionExample
{
  class Class1
  {
    ~Class1()
    {
      Console.WriteLine("Destructor");
    }
  }
  class Program
  {
    static void Main()
```

HARSHA

```
    {
        //create two objects
        Class1 c1 = new Class1();
        Class1 c2 = new Class1();

        c1 = null;

        //delete all the objects
        GC.Collect();

        Console.WriteLine("Garbage collection done.");

        Console.ReadKey();
    }
  }
}
```

Running the Project

- Go to "Debug" menu and click on "Start without Debugging".
